Task: Register & Login

Feedback Received: The menu made it easy to click to register. Text input boxes worked as expected and were easy to use. I did not know which were requirements for registering and optional inputs. Logging in was all right but did not give any feedback whether the login was right or wrong.

Actions taken to fix problems: I added '*' to each required field on the register page. This should help users understand that not all the inputs are required to make an account. I added a red message stating the login was wrong if login failed due to wrong input data.

Task: Setup a meeting

Feedback Received: It was easy to start the creation process for a meeting. However, I was unsure how I should input the time and date and what format would work. Everything else seemed good

Actions taken to fix problems: I agree the format required for creating a time and date was ambiguous. In the message I put an example of what is expected for an input method/format.

Task: Get the weather of a location

Feedback Received: It was very easy to get the weather for a location. I liked how you did not need to specify the location straight away as it was flexible. Some places were not included.

Actions taken to fix problems: it is hard to get a sure way of looking up weather for every single place due to the vast number of place names. I added more custom locations specific to NZ, hopefully this should relieve some issues.
